Pope Francis' treatment for a respiratory tract infection "will require adequate hospitalization" to address what the Vatican is now describing as a "complex clinical picture."

According to a Vatican bulletin released at 1 p.m. local time on Feb 17, ongoing test results have shown a "polymicrobial infection of the respiratory tract." The statement said that the pope's medical team has modified the treatment for the 88-year-old pontiff following the latest developments.

Francis, who has battled bronchitis since the start of the month, was first [hospitalized](#) on Feb. 14. In the previous weeks, Francis had been short of breath and struggled to speak during many of his public appearances.

While the Vatican has previously [stated](#) that the pope's condition has improved since he was first admitted, the latest update indicates the pontiff's situation remains serious. The pope's medical team has ordered complete rest for the octogenarian pontiff.

On Sunday, Feb. 16, the pope did not recite his weekly noontime Sunday Angelus prayer, marking only the second time he has missed it during his 12-year pontificate. The last occasion was in 2023, following an operation on his intestine.

Outside of Rome's Gemelli hospital where Francis is being treated in the special 10th floor wing reserved for popes, a number of votive candles have been left by well-wishers offering prayers for the ailing pontiff.

This is now the second longest hospitalization Francis has undergone. The first, in 2021, required a 10-day stay following the removal of a portion of his colon.
